INDIAN INSTITUTE OF TECHNOLOGY, KHARAGPUR
End-Autumn Semester 2018-19

Date of Examination: 22/11/2018 Session (FN/AN): FN Duration: 3 Hours Full Marks 50
Subject No.: HS40091 Subject Name: DERIVATIVES
Department/Center/School: Humanities and Social Sciences
Specific charts, graph paper, log book etc., required: None
Special Instructions (if any): (i) Answer all the questions. (ii) Use of non-programmable calculator is permitted. (iii) While answering all the necessary steps/calculations should be clearly shown. (iv) This question paper contains 2 printed pages.

---

1. What is a lower bound for the price of a four-month call option on a non-dividend-paying stock when the stock price is \$28, the strike price is \$25, and the risk-free interest rate is 8% per annum? Option Pricing (2)

2. A trader sells a strangle by selling a call option with a strike price of \$50 for \$3 and selling a put option with a strike price of \$40 for \$4. For what range of prices of the underlying asset does the trader make a profit? Advanced Option Strategy (2)

3. "A box spread comprises four options. Two can be combined to create a long forward position and two can be combined to create a short forward position." Explain this statement. Advanced Option Strategy (3)

4. An investment management company called IVM wants to enter into an EQUITY SWAP to pay the return on the S&P's 500 Total Return Index and receive a fixed-rate. On the day the swap is arranged, the index was at 2,710.55. The swap will call for payments every 90 days for a 360-day period. Financial Swaps (FNS), the dealer, offers IVM a fixed-rate of 3.45% with payments. The notional principal is \$25 million. The 90-day, 180-day, 270-day and 360-day index was 2764.90, 2653.65, 2805.20 and 2705.95 respectively. Construct a table and show the cash inflows, outflows and net payment made/received by IVM for 90, 180, 270 and 360 days respectively. SWAPs (4)

5. A swap was entered by an Indian firm with a bank converting its rupee liability into British pound where the firm received 10% on Indian rupee and paid 5% on British pound. The amount of principals involved are Rs.120 million and £1.5 million fixed at the then exchange rate of Rs 80/£. The swap has 4 semi-annual payments to follow. Assume the next payment is due after 6 months from now and term structure in Indian rupee and British pound is flat at 9.00% and 5.50% respectively for the next 2 years. If the current exchange rate is Rs 82/£, what is the value of the swap for the Indian firm and the bank? SWAPs (5)

6. Intel and Microsoft have equal requirement of funds of $50 million each. They have been offered following rates in the fixed and floating rate markets for debt:

	Fixed Rate	**Floating Rate**
Intel	10.00%	LIBOR+50 bps
Microsoft	12.00%	LIBOR+150 bps

Intel wants funds at floating rate while Microsoft is happy to raise funds at a fixed rate basis. A bank is willing to act as intermediary with 20 bps as its remuneration. Depict a swap sharing the gains of swap equally and find out cost of funds for Intel and Microsoft. What would be the saving in financing cost of each firm? Bank Swaps (5)

7. Three put options on a stock have the same expiration date and strike prices of $55, $60, and $65. The market prices are $3, $5, and $8, respectively. Explain how a butterfly spread can be created. Construct a table showing the profit from the strategy. For what range of stock prices would the butterfly spread lead to a loss? Advanced Option Strategy (5)
Butterfly Spread

8. Calculate the price of a call option using Black Scholes option pricing model written with strike price $21 and a maturity of 3- months written on a non-dividend-paying stock whose current share price is $25 and whose volatility is 23%, given a short-term risk-free interest rate of 5%. Also, calculate the price of a put option on the same stock, given the same risk-free interest rate. Option Pricing (6)

9. Suppose that put options on a stock with strike prices $30 and $35 cost $4 and $7, respectively. How can the options be used to create (a) a bull spread and (b) a bear spread? Construct a table that shows the profit and payoff for both spreads. For what range of stock prices would the bull and bear spread lead to loss? (4+4) Spreads - Adv Option Strategy

10. (A) An asset is trading at $40 with volatility of 30%. The risk free rate is 8%. The exercise price of a call is $40 and the maturity is 6 months. Calculate the Delta, Gamma, Vega, Theta, and Rho of the financial institution's position. Interpret each number. (10)

(OR)

(B) (i) Consider a 2-year European put with a strike price of $52 on a stock whose current price is $50. Over each of the next two time steps of 1 year and in each time step the stock price either moves up by 20% or moves down by 20%. The risk-free interest rate is 5% per annum with continuous compounding. Calculate the value of a 2-year European put option using Binominal option pricing model.
(ii) Elucidate the factors affecting options prices. (5+5)

=====X=====X=====X=====X=====X=====X=====X=====X=====X=====

Table for $N(x)$ When $x \leqslant 0$

This table shows values of $N(x)$ for $x \leqslant 0$. The table should be used with interpolation. For example,

$$\begin{aligned} N(-0.1234) &= N(-0.12) - 0.34[N(-0.12) - N(-0.13)] \\ &= 0.4522 - 0.34 \times (0.4522 - 0.4483) \\ &= 0.4509 \end{aligned}$$
